Skin cancer is the most common form of cancer throughout the world.

Five million people are treated annually and people over the age of 70 have a 1 in 5 chance of developing skin cancer during their lifetime\(^1\). There are various types of skin cancer. One of the less common – but most dangerous – is melanoma which is more likely to spread to other parts of the body if not discovered and treated early. The key to early detection is knowing the signs of possible melanoma\(^2\):

<table>
<thead>
<tr>
<th></th>
<th>Asymmetry. One part of a mole or birthmark does not match the other.</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Border. The edges of the mole or birthmark appear irregular, ragged, notched or blurred.</td>
</tr>
<tr>
<td>C</td>
<td>Color. There is inconsistency in the surface color.</td>
</tr>
<tr>
<td>D</td>
<td>Diameter. The spot is wider than a quarter of an inch.</td>
</tr>
<tr>
<td>E</td>
<td>Evolving. You notice the spot has changed size, shape or color.</td>
</tr>
</tbody>
</table>

By following the A-B-C-D-E method and performing a self-examination on a monthly basis, you can identify potential skin cancer early and seek diagnosis from a dermatologist.
The journey forward following diagnosis.
Do you or a loved one show signs of skin cancer? We encourage you to be proactive and see your primary care physician or dermatologist. You are also entitled to seek a second opinion. This can reduce anxiety and help your team focus on the right treatment option. It’s natural to have questions and concerns.

/// As a SISC member, you should know about enhanced benefits including the Oncology Center of Excellence (COE) Program which provides access to the highest level of cancer specialists often at no direct cost to covered members.*

Here for you throughout the process.
We are here to help guide you along the way including enrolling you in the Oncology Center of Excellence Program, managed by Contigo Heath, LLC.

/// Did You Know?
Anyone can develop skin cancer, but there are characteristics that put certain people at greater risk³, such as:

- Lighter natural skin color
- Propensity to be sun burned, have freckled skin or many moles
- Blue or green eyes
- Blonde or red hair

As with most cancer, family history is also a good indicator of higher risk.
